

How to Seize a Once-in-a-Lifetime Wealth Building Opportunity with Precious Metals

By Andy Shaw

October 21st to 22nd, 2024 (re-edited 9th April 2025)

A Fast and Simple Guide to Positioning Yourself for Massive Gains Amidst Global Economic Shifts

Introduction - Please Read, This Bit is Important (I Don't Want to Waste Your Time or Mine)

Before I begin, please understand that every statistic I talk about in this brief guide is approximate. I have no need for complete accuracy, as this guide is designed merely to spark your interest—for you to take it from there.

However, here's a friendly warning: **EVERYONE**—yes, everyone—will wish they knew in a few years what I'm about to share with you. So I strongly suggest you don't underestimate the value of what you are about to read, even though I haven't done detailed research to provide you with specific and accurate data.

I suggest you use your discernment as you read, and you will discover all sorts of hidden value here. Let your intuition guide you because I fully intend to shock you. What's contained here is indeed shocking. While reading, also consider that this might just be exactly what you've been looking for to make your life a lot more relaxing, rewarding, and, of course, richer too.

My Ulterior Motive

For sharing this shocking value with you for the princely sum of zero, yes, I do, of course, have an ulterior motive. Everyone who does something for free has one. But, in fact, I have two.

I have written this guide for you to achieve two things:

1. To explain to you (in a shocking way so that you take notice) what the opportunity is right now and for you to take advantage of a wealth cycle change that is finally happening. My reason for doing this is known as "giving without expectation," and the Universe has always rewarded me handsomely for it. I have found making conscious people money is a very good way to make long-term friends.
2. To attempt to convince you to take a look at joining me and some friends on a Mastermind retreat in Hampshire England on 12th to 19th June 2025. My reason for doing it is to build a mastermind group where we can collectively help each other regarding mindset support and opportunity notifications on an ongoing basis, thereby maximizing the gain from this once-in-a-lifetime opportunity.

However, that said, not one word of anything I say regarding investing can ever be misconstrued as financial advice. I am not a financial advisor, I am not licensed to give financial advice. Frankly, I wouldn't want to take the pay cut to become one, and I definitely couldn't handle the frontal lobotomy needed to do it. I am a talented amatuer who just happens to have found himself by accident in the top two percent of traders in the world. Turns out all it needed was a system.

The Rules...

You are reading this on your own. I am not your savior. I am here to say, "Look, here's what I've done, what I got right, what I got wrong," and I think you'll discover there are riches waiting for you well before the end of this guide.

All I am is your guide; **you** are your savior. What you need to bring to this party is your discernment—whether or not what I say is true or false. If you decide it is true, then you have to determine if you're willing to put in the work required or take a shortcut for a price. Lastly, you need to decide the level of risk you're comfortable with.

There are no fictional guarantees or government regulations to protect you from what I am about to share. You must be a grown-up and deal with the adult world, leaving behind the world of governmental parental control.

Well, that's IF you want to make more and work less than you would by working within a system that supposedly "protects you."

This is a choice—and, as always, choice is the problem.

The best I can recommend is, rather than overthinking here, follow Olivia Newton-John's wise words: **"feel your way."** So, while you watch your thinking, pay close attention to how this guide makes you feel.

Ask yourself: does what I write feel right to you, or wrong?

If it feels wrong, leave it. Almost certainly, it means you need more pain before you're ready to change your situation. But I don't expect you to believe that today. I would also expect you to think, "Well, he would say that." I wish you well if that's the case, but this is not for you.

However, **if it feels right**, then you're probably not a socialist. It likely means you can simply feel common sense. But I'll leave that for you to figure out.

So I'll begin by telling you the two paradigm shifts that happened for me in the last week which has spurred me to finally leave my retirement, and actually do some actual work. Why? Because I finally feel I can add adequate value to you in terms of spending your time and investing your money in my 'crazy' theories.

To find out how, read on...

1 - Two Paradigm-Shifting Moments That Led Me to Write This for You

Since the world changed in 2020, I saw what was coming and moved most of my wealth into the precious metals sector, with the foundation being precious metals stored safely in numerous jurisdictions. After that, I wanted to see if I could gain a greater return than I would get from the metals themselves.

So, I looked at the Precious Metals Market and spent about a thousand hours researching it before I put a penny into it. Then, I quickly found out how to tie up funds by buying stocks and watching them drop 30-50% or more, with the occasional "winner." I knew there had to be a better way. Being lazy and always looking for a shortcut, I was sure there was an answer.

So, I studied more and opened other accounts, too. I applied various strategies. The experts' advice was all over the place. One would say, "You must do this," while another would say, "Whatever you do, don't do that." It was a mess—the same problems I had encountered in many other interests throughout my life.

My main advantage, though, was my ability to discern well. This allowed me to work out who were true experts, who were well-intentioned, and who were con men. I improved, and things began to look better. My understanding of the market grew, and my ability to discern well regarding the macro world, my fundamental understanding of the asset, and the ranking of investable companies (after evaluating around 400 of them) gave me confidence in my ability to pick good companies.

But...

One thing remained: I couldn't get the timing right. I'd buy in, and the stock might lose 5-20%. Eventually, I'd either sell to prevent further loss, or there would be an unforeseeable company shock, and I'd be down a fair bit.

By this point, I was about 3.5 years in, maybe a bit more, with probably around 10,000 hours of studying the market and how it worked. I kept wondering why the market would get slammed down, why things wouldn't rise when they should, and why technical charts sometimes failed while other times worked. I was looking at 300-500 charts daily, in varying time frames. Slowly, I started to make consistent returns.

My friend Nicola, who got me into technical trading analysis, asked what I was doing, and I told her I was following her advice. Yet, I still got caught at times, learning what **not** to do, though I could feel I was making real progress. It's amazing what happens when you sink countless hours into something.

But one thing kept bothering me... Virtually all the experts were saying the same thing: **"You can't time the market."** This felt wrong to me. Then, one day, I realized that some people must be able to time the markets; otherwise, it would all be random, and like gambling, you'd eventually lose due to the time spent sitting at the table. I just didn't realise it was only 2% of traders could do this.

So, I knew the experts were at least partially wrong. It reminded me of times in the past when I'd gone against the experts and found shortcuts they'd missed. Like when I went into property investing, set myself a goal of becoming a millionaire in two years, and achieved it in six months—with the title of multi-millionaire coming just two weeks later. I felt I was on the right track.

I was making money, then losing money, but I was still ahead, I was still in the game! The market would swing up, and some precious metals stocks would follow—some wouldn't. I was starting to see patterns. About six months ago, I read the patterns correctly for the first time—well, 65% correctly. I took 80% of the upswing as profit, buying close to the bottom and selling just after the top, after it had dropped by about 10%.

Was it a fluke, though?

Then I did it again, except this time I was more like 80% accurate. The companies I exited mainly fell in value. Then, when the time was right, I got back in and rode them up again.

Did I fluke it again?

No.

I could see it—the pattern was there. Sure, I missed out on the ones that pulled back and carried on, but it didn't matter. I always had more companies to invest in than I had money to invest.

So, I had begun living the adage, **"buy low, sell high."** Not just thinking about it, not just intellectually understanding the obviousness of the phrase, **but living to it!** *Which is a world of difference, and part of why 98% get it wrong.*

Like in real estate, I could feel the market. I showed my friends, and they could see and feel it too. One of my friends, who shall remain nameless, is a complete amateur when it comes to technical analysis, but now he can pick upswings and downswings better than people I pay thousands of dollars a year to listen to.

By accident (again), I had found a shortcut to reading the markets. One even an amateur could learn.

It reminded me of when 15-20 people would come once a month to buy me lunch, and I would show them a real estate deal in their area that everyone had missed—hidden in plain sight.

But I still wasn't an expert. I may know the companies to an 80% due diligence level, and I may know the market to an 80% level, but I wasn't prepared to become an expert like the ones I listen to. They put in way more time and effort than I was willing to.

I decided to get into this with a small percentage of my net worth and see if I could find a way to make enough money from it that I'd could leave my children a lot more money to blow..

I didn't need to become an expert for that, but I did need a few skills:

- I needed risk management so that if the world went into a tailspin, I could step off and cut my losses.
- I needed it to be easy and entertaining enough to keep me interested.
- I needed it to be worth it. Even though I had spent four years learning, now that I'd learned enough to get consistent, I wanted substantial returns. As to just how massive they'll be—ask me in a few years, but it is extremely unlikely they will be insignificant
- I needed it to not take up too much time. I wasn't prepared for it to be a full-time job. It had to be something I could pick up and put down.

Lastly, I knew the market would work because the whole sector is moving forward. As the great Bob Moriarty said in a recent interview, the only technical analysis tool you need right now is a "dart."

What Bob didn't convey was the pain of a stock dropping after you buy it. But he did convey that the whole market was going up, and you just had to sit in it to win.

But my original efforts showed me that sitting in the market was painful. ***I wanted to be in when it went up and out when it went down—and now I'd found a way to do that.***

So, I was pretty chuffed with myself, without the hubris that normally accompanies this kind of success.

Then, the other day, my paradigm shifted...

I went for dinner at a friend's house. He's a fair bit older than me, but he looks good for his age. But that's not really relevant. My friend used to run a foreign currency trading desk for one of the major banks in London. He was actually Nigel Farage's boss in the old days.

Well, in the '90s, he had to quit because the pressure was too much, and he changed his life 100%, moving away from anything financial. I only met him a few years ago. He was the husband of my wife's friend.

One of the funniest people I listen to in this space is the wonderful Bob Moriarty. This from just last week...

"There's about 500 Black Swans in the sky at the moment, I'm pretty sure one of em' is going to take a dump!"

Anyway, I helped him make some money in Bitcoin and also rekindled his ability to make money trading. Obviously, he knew my mindset was a massive advantage in trading, as that had been what did him in years before.

So, over the last eight or so years, we've been chatting about trading and various macro news. This was a real benefit to me, as he was a professional trader who had previously managed many professional traders.

Well, as I was saying, I was at his house last week, and his wife is a great cook... After dinner, we were chatting about stock picks and success/failure stories. I told him how accurately I'd called the market and over 80 stocks in the last few months. He laughed at the number I was managing and said, ***"That's a lot more successful than you need to be!"***

I replied, *"Well, obviously, I'm not an expert,"* and he stopped me. He said, ***"No, you weren't an expert. You aren't an expert at it all, but you're looking at tens of thousands of charts a year now, and you've captured 65 to 80% of the last two momentum swings. Which means, you are an expert now."***

This blew me away because coming from someone of his skill meant I had to take it seriously. Had I done it again by accident? Had I become an expert just through interest, without setting out to be one, in a new area by mistake yet again?

The answer was yes and no. No, I am not an expert, yet I am also an expert. I like to think of myself as a talented amateur.

Him saying I was an expert, it made me feel good, but it didn't change anything. I was still going to continue learning, attempting to capture a higher percentage of the moves, and lowering the number of stocks on which I had losing positions. As I type, I have one portfolio with 93 stocks in it, and 84 of them are in profit, with 9 running at a loss. The total loss of those 9 stocks is covered by my 6th most profitable trade. The other 83 stocks are in profit with no loss. This is approximately halfway through the current momentum move, so I would like to think I can get those 9 losers out of the red too. I should also add, I didn't need to sell any losers to make it just those 9, so no games there.

So, I went to dinner on Friday and was still ruminating on what my friend had said to me. Then, this morning, I was remembering a place I stayed in Costa Rica a few years ago. I was there for a mindset training event and a holiday with some good friends.

It felt great, but it was a lifetime ago, as I was out of that type of business. In fact, someone asked me on the [weekly webcast](#) this week what I was manifesting at the moment, and I said I wasn't, as my life was pretty good, and I definitely didn't want to do business again.

We have such a good group on [the webcast](#) each week, and we had such a good group at the training all those years ago in 2018. Then I connected the dots. I thought, I could teach this to people. They'd easily make the cost of the event back from the knowledge, probably within a couple of months (Update: the first person a farmer from New Zealand actually achieved that in just 34 days). Plus I'd probably make some more good friends, and, of course, I'd get to have a holiday with my current friends.

So, that's why I'm writing this for you today.

(Update - there weren't enough hotel rooms for everyone in Costa Rica so we decided to not hold it there, but instead we chose Playa del Carmen Mexico - the event was a blast!)

This guide is designed to teach you numerous things about gold, silver, and the precious metal mining stock opportunities. So, even if you don't want to come to Mexico or the UK with a maximum of 24 other people and my friends, *you'll still get massive value from this guide!*

But if you do have some capital behind you, and you'd love to be part of an ongoing mastermind focused on growing and leveraging that capital, and if you fancy coming to Hampshire, England with me and my friends for a 7 day strategic mastermind and an extra day relaxing with the group—where we will bring you up to speed, and you'll get to meet the other members we'll be working with over the following year (maybe longer)—then I'd like to welcome you to join us.

[Click here to book your call:](#)

Over the last few years, I've enjoyed sharing the journey with a few close friends of mine and have seen how they've benefited. These poor people (who you'll get to meet) listened to me before I got it right. So, I look forward to seeing others go through an accelerated growth curve now that I have more than adequately de-risked it. I also look forward to building long-term friendships with others focused on a similar goal, while they make a load of money in the process.

Obviously, I cannot guarantee that, especially since you may mess it right up depending on your mindset. However, it looks highly likely that making a load of money is more than probable.

A few no-no's: Sorry, no socialists. I can be friends with socialists, but mainly they are not realistic about making money, though they often think they are. I am looking for long-term friendships with people who like making money in a fun and easy way.

If you'd like more details, [all of the event details are here:](#)

And, if I have failed to answer any questions, I will add a blog post to my Substack called Questions About Attending the Mastermind, and I'll answer any missing questions there. [Click here](#) for that.

2 - We Are Living Through the Death of FIAT Currencies

It's not that the price of gold is rising, it's that the value of FIAT currencies is falling.

What emerges from the death of these currencies is yet to be certain, but they have now passed their terminal illness point. This means death is certain; we just don't know when it will happen. (*Update - the EURO now has an expiration date of 31st October - look it up!*)

As was said in Monty Python's *Life of Brian*, "*It's happening now.*" But unlike the People's Popular Front of Judea, we do have time to think about it and make plans. However, the time is running out to be in at the start and make the most gains.

To capture those, you had to be content with being wrong for the last few years (for me), and a lot longer than that for most of "the experts" (not that I am trying to associate myself with being an expert. I am not; I am a talented, potentially very talented amateur).

But the good news is, the theory of the end of FIAT currencies is no longer just a theory. The math is baked in now. Plus, as I am finishing this guide, the world is witnessing the most significant meeting to take place since something called Bretton Woods on July 1st, 1944.

That Bretton Woods meeting, and the subsequent poor decisions by the leaders of the West, have had more of an impact on you and your family's lives than you or I can possibly imagine. In short, that was the meeting where the world decided to go the wrong way, and the meeting that is just taking place now is where the rest of the world is going to go the right way and abandon the Bretton Woods system.

So, What Are FIAT Currencies and How Are They Failing?

FIAT currencies are currencies by order of the government. In other words, the government says, "This is money." It isn't. Money has no counterparty. Currency is a debt instrument. You think those dollars in your wallet are really yours. They are just a promise to pay someone at some point. They are not money, they are currency. That seemingly tiny difference is responsible for most of the world's problems... But I don't expect you to believe that yet, as that requires a lot more understanding.

To some, all this is obvious, and to others, it's some fancy jargon that makes no sense. So, for the remainder of this guide, I am going to speak in very basic terms only, so as not to scare off people who need what I am sharing.

Because all assets with the exception of real stuff like gold and silver are supported by the debt-based system which the whole world is using. Which means, when confidence is lost, the value is lost too. That's bank account balances, pensions, stocks, bonds, real-estate. So only

people with none of those don't need to have an understanding of this. I'll let you decide if this is kinda' important or not...

The government, based on the value of its economy (i.e. all its assets and your past, current, and future labor), issues a piece of paper and says it's valuable. We, based on our confidence in them and their ability to run the economy, therefore trust their currency.

You may have already noticed the hidden flaw in their plan...

For example, having a man with dementia run the U.S. government for four years, and having his Vice President then not notice he was incompetent, and subsequently carry out a coup on him so that she can run, only to say she wouldn't change anything he'd done...

Well, that doesn't exactly instill confidence in their system. Add to that the \$1 TRILLION they are adding to the national debt every 90 days, and you can see this does not bode well for confidence. It'll be every 80 days soon, then every 70 days, and on and on... Tick tock goes the clock!

Most are hoping Trump can turn it around, and granted, he will give it a go. But he will fail, as the majority of the world is turning away from FIAT currencies. When the first country turns back to backing their economy with gold, that will be the final nail in the coffin for FIAT currencies.

But success with precious metals is not reliant on all this happening, and I personally would love for Trump to turn it around. I just score it as "highly unlikely" on my probability scale. And I make money on my "probably" to "highly likely" bets, which means I am betting, (as is the smartest money in the world), that he at least struggles.

(Update: Estimates indicate that approximately \$10 trillion has been wiped off worldwide market capitalisation since Trump's tariff announcement less than a week ago - I am not saying tariffs are good or bad here - just indicating the confidence issue)

According to statistics, if you believe them, in 2023 there was approximately 212,582 tonnes of gold in the world, including about 3,000 tonnes mined that year. Which means there was 1.41% more gold in the world in 2023 than in 2022, or more appropriately, that the amount of gold in the world inflated by 1.41%.

Yet, the U.S. said their annual inflation rate was 4.1% in 2023. So, 300% more than the gold supply, which supposedly backs the currency to some level. **Shadowstats**, a website devoted to accurately tracking inflation and other statistics based on the way they used to calculate inflation

in the 1970s—a time before they had to start changing the way they calculate it to hide how much value the U.S. Dollar (and all other FIAT currencies) was losing—had the U.S. inflation for 2023 at approximately 8.2%. So, double what the government says, or 581% more than gold inflated that year. Is it any wonder, then, that the gold price since 2000 has risen from \$289 an ounce to today's \$2,730 an ounce? (Update: \$3,051 as I type)

Is your pay up that sort of percentage?

No, of course not. Inflation is a stealth tax on your life. ***They are stealing from you, and you need to protect yourself from the theft!*** This is why you must have two positions in each precious metal (gold and silver).

Your first position is for insurance, which in my highly unprofessional opinion is a minimum of 5% of your total net worth (last reminder, I am not an expert, never will be, and don't ever intend to be—just a talented amateur).

Your insurance position only needs to be 5% because when gold resets its value, the price of it is more likely to be in the \$25,000 to \$100,000 range than in the current \$3,000 range - yes I know it sounds unbelievable, but wait and see.

So 5% should insure you. It might not cover all that gets wiped out as the FIAT currency dies, but it'll cover most of it. And since prices will likely deflate in most non-essentials, maybe it will cover everything—I don't know for certain, but I bought insurance.

I am not going to explain why that price range for gold is actually likely to be conservative, because if I did, you would almost certainly doubt it and ignore everything I write because of that. However, there are plenty of sources out there for you to learn from. Start with *Liberty & Finance* on YouTube, and you'll be researching in the right location. Watch 30 hours of their videos, and you should begin to get your head around the scale of the opportunity.

Your second gold position is for investment. This is the amount of your available funds you want to speculate with, but I'll cover that more later.

Your first silver position is for insurance too, in the smallest denominations possible. This is what they call "junk silver" in America—pre-1964 silver coins that had a high percentage of silver in them. I currently live in the UK, but I bought a fair few bags of dimes, quarters, etc.

Why did I buy U.S. coins? Because silver is silver, and in coin form, it is recognizable. I don't like bars in either gold or silver because who knows if they are real or not? Yes, you can do tests, but I can't be bothered with that stuff—I only want easy. You want the smallest denomination of recognizable silver possible so that you have money when FIAT dies. Insurance remember.

Or when other stuff happens—like the people in North Carolina who couldn't use debit cards, didn't have cash, but could've easily traded with silver.

Because I am in the UK, the majority of my silver is kept in UK silver coins, Silver Britannias to be exact. I do this because in the UK there is no capital gains tax on them when I sell them. Most countries don't have this advantage. But worrying about the tax side isn't that important when the value of something is likely to go up to a ridiculous level.

Briefly, a Side Note on the Current Silver Price

Silver is currently trading at two-thirds of the price it was in 1980. Do you know of anything else on Earth you can buy today for two-thirds of the price it was in 1980? No, you don't.

So what's going on?

The price has been suppressed for years to protect FIAT currencies. That's the truth, and you can either know I'm right or believe I'm wrong. There are experts in my world who are on either side of this debate. But I have many discernment and intuitive advantages over the vast majority of people, so you decide—or rather, ***why don't you have a go at feeling what's right?***

The true price of silver today, based on inflation-adjusted prices, is in the range of \$150 to \$230. That's the price it should be today compared to its 1980 price. Pretty good... But wait, there's more.

Back then, gold was \$850ish in 1980. Today, it is \$2,730. So, to correct the price suppression, silver should be 320% higher than its inflation-adjusted price. Or put that into dollars: \$480 to \$736.

Can you feel that too? Its price today has just gone past \$34.

For more accuracy than that, refer to Mike Maloney's latest book, *The Great Gold & Silver Rush of the 21st Century*. All I did was a back-of-the-napkin calculation. From memory, Mike has the same calculation as being over or close to a \$1,000 value today.

But let's work with the lowest price of \$480, and also assume the price of gold stops rising (which it won't (Update: told ya :-)), and by the time you read this, it should be well past the figure I'm using today. This means you are probably going to make around \$450 for every ounce of silver you buy today.

I'll pause here for you to take that in and imagine what it would mean for your life if/when that happens...

Once again, the adult warning comes out. At a specific moment, this could be wrong, and it could go down. But over time, the FIAT currency will die. How much Zimbabwean currency would it take to buy one ounce of silver today? Billions, no doubt, if it could even buy it.

I remember when I wrote a book on Bitcoin. I started writing it when Bitcoin was circa \$5,000. By the time I finished the book, it was \$13,000 (approx). It went to \$20,000 and then dumped down to \$3,200-ish. I had a socialist child complain to me, saying I had caused them to lose money. That same Bitcoin is \$68,500 today. I tell you this because I am not interested in children in

adults' bodies (socialists), especially when it comes to educating people on speculating with currency to make additional real money.

You may have guessed by now that I am trying to put the socialists off from reading this. Frankly, we don't need any more rich socialists in the world to come. What is essential is rich, highly conscious, conservative-leaning people. So, if that is you—or you want it to be you—I am targeting you.

The second position you want for silver is an investment position, and I'll cover that further on in the guide. But the word "investment" should really just be interchanged with the word "speculation" whenever you see it. So forgive me if I misuse it when I should be saying "speculation." Your first two positions in gold and silver are investments; your second two positions are investment/speculations.

It is all going to come down to how you feel about risk—and what you view as risk. I view FIAT currencies depreciating at a rate of at least 8% per year as **very** risky. But that's me. My opinion is that anyone who holds all of their assets in the FIAT currency world will be mostly, if not entirely, wiped out.

And when I say wiped out, I mean most of the equity in their house—gone. Most, if not all, of their pension fund—gone. The value of the currency in their bank account—gone. Maybe even the currency itself—gone! And then there are the business fallouts. I can comfortably say I see a depression worse than the Great Depression coming, and that will wipe out a heck of a lot of jobs too.

So when does this all happen?

It's happening right now, or rather, it has started speeding up right now. The depression actually started in 2007, but I don't expect you to believe me on that one yet. We'll have to re-look at that in about 10 years' time. But the fall is happening now, and it is going to get faster, then have a little pullback, go fast again, and repeat that a fair few times.

So there are some bumpy roads ahead. But everything will go into "Ludicrous Speed" when the public finally figures out that inflation is not happening by accident, but rather as a plan to kill off the government's debt.

When the public figures this out—and yes, they actually will—at that point, the rush to physical assets of value will be unlike anything the world has ever seen.

Don't worry, I don't expect you to believe me... You'll figure that out for yourself somewhere through this.

But first, there's this...

3 - A Very Brief Bit of History and Why It Is Important to You

In 1944, the remaining world powers met at a hotel called Bretton Woods, where they came up with a new plan: the USA would be the world's reserve currency, and every other country's FIAT currency would be attached to the almighty U.S. dollar at different but specific amounts.

At the time, dollars were redeemable for gold, and you could buy an ounce of gold for around \$35. Americans couldn't buy gold as that had been made illegal in 1934. That was later repealed in 1973, so currently, Americans can

buy gold too.

The price of gold was artificially held down when the U.S. began struggling because they were spending too much on dumb stuff like the war in Vietnam and really stupid socialist programs. The price of gold went to \$38.90. Then finally, in August 1971, after significant pressure from countries asking for their gold back, President Nixon took the world off the gold standard, and FIAT currencies in all countries were left floating.

Imagine, if you will, each currency as a balloon filled with helium. They were all tied to the dollar balloon, and the dollar balloon was tied to the ground thanks to all the gold it had. There was no way the helium-filled balloons could ever drift off as they were tied to the ground. Then one day, Nixon cut the string between the dollar balloon and the gold... and off they went into the sky. They have been floating away from real money ever since.

By 1980, gold had risen to \$850. In other words, it now took nearly \$22 to buy what \$1 bought in July 1971. But it got worse. By 2011, it took over \$49 to buy what \$1 bought in 1971. And today, it takes over \$70 to buy what \$1 bought all those years ago.

The government and ignorant people (mainly socialists) will tell you it is companies price-gouging and people getting too many pay raises. But it's not. This is due to inflation. As Milton Friedman said about inflation, *"It is always and everywhere a monetary phenomenon."*

Or, to simplify it: **the government has been printing money and robbing you of value every second of every minute of every year since 1971.** And it goes almost unseen as if it is natural.

It is not.

If we lived in a system where gold and silver were the only forms of money, then there would be little to no inflation. As was proven throughout the 1800s. Look it up, or choose to take my word for it—your choice.

The dollar used to be a weight of gold or silver. It's even written in the Constitution. The British Pound used to be a single gold sovereign.

Fun Story...

On February 15th, 1971 (strange how that year was so important), Britain went to the decimal system. Prior to that, there were 240d to the pound. For countless years up to 1914, a pint of beer cost 3d, or 1/80th of a pound—meaning you could buy 80 pints for a pound. Nice!

In Britain today, the average cost of a pint of beer, according to a site called *Pint Prices*, is £6.14. So 80 of those today cost £491.20. Quite the increase!

But what's interesting is that beer, priced in gold, is almost exactly the same as it was in 1914. As I write this on Monday, October 21st, the price of a pre-owned gold sovereign is £505.99. So, you can buy 80 pints today for £6.32/pint with that single gold sovereign. I don't know about you, but I'm okay with inflation running at that level over 110 years.

With oil, the price has actually deflated against gold. In other words, you can buy more oil today with an ounce of gold than you could in the 1950s. This is one of the reasons why Russia and Saudi Arabia are moving back to gold. They know the West is stealing from them.

Now, what the central banks (aka the blood-sucking vampires ripping your life energy from you) will tell you is that deflation is horrendous. They want you to believe that prices going down is terrible and will mess up the economy and your entire lives. Well, personally, I'd like it if, when I went to the shops, things got a little cheaper each time. Call me stupid, but I like things getting cheaper.

Do you know who doesn't like things getting cheaper?

The central banks and the governments. Things getting cheaper kills their Ponzi scheme - they need prices to keep going up, borrowing currency created from fresh air to keep their Ponzi scheme going.

So, they have written into all the economic education that inflation is essential for the world's financial system. No, it is essential for **their** financial system because theirs really is a Ponzi scheme. They rely on new currency being created by robbing value from the existing currency.

This is why they love it—**it is theft**, and 99.99% of people do not understand the process. But pretty soon, within the next few years, 100% of people will.

Side note: One of the core arguments against a gold standard is that there isn't enough gold in the world. Simple reply: **bullshit!** One ounce of gold and a way of tracking how much you own of it is enough gold.

But before I get distracted and make this way too long, I won't answer every question here, as I am not writing a book—just inspiring you to go and learn.

So, 100% of people are going to soon understand that inflation is robbing them and that it has always been the government's plan to do so. At a deep level most people can already feel something is very wrong when you pay two or three times the price you used to pay. This is how FIAT currencies fail over time, people wake up and feel it is wrong so instinctively go and find solid value. ***Can you imagine what happens when 100% of people want to buy what less than 0.5% of people currently own?***

Did you know that there have been thousands of FIAT currencies, and the average lifespan of them is 31 years? History gives the survival of a FIAT currency a probability of **ZERO!**

The current FIAT currency system is 53 years old. It is the longest-surviving FIAT currency ever. Think of it this way: a Tapir has an average lifespan of 30 years. ***The U.S. dollar and every other FIAT currency are the world's first 53-year-old Tapir!***

How do you feel about having the vast majority of your lifetime's net worth tied up in a Tapir that is over double the average lifespan of a Tapir?

Do you feel uncomfortable yet?

Because if you don't, then I have either failed to inspire you, or you are a raging socialist who literally understands nothing about real money.

We are not yet in hyperinflation, which is usually how FIAT currencies die. We may never get to hyperinflation, as I know they fully intend to swap out the current dollar, pound, and euro ahead of that happening.

(Update: This is no longer a theory, as they are swapping the EURO for a digital EURO on 31st October 2025 - currently I expect the dollar to be split in two one external, one internal currency. With the internal one being backed in some way by gold. And the external one will find it's true value - ie, it will hyperinflate America's debts away. The pound will follow the EURO if the EU gets away with this level of theft and control).

They are hoping and betting on the vast majority of the population not noticing them robbing at least 90 to 95% of their current net worth in the process.

Will they achieve it? Who knows. I didn't think people would be dumb enough to fall for everything we've seen in the last 4.5 years, but they did—and most still do.

But my main point is, gold going from \$2,730 today to tens of thousands in the near future at least ensures that a level of hyperinflation is coming. And because you are reading this, you have an opportunity to ride the wave of the dollar, pound, and euro losing all their value—and gold taking it all away from them.

Simply put, you've got to get into gold and silver. And after reading this, if you aren't in a little bit of a panic to do so, then unfortunately your thinking is currently misguided, as you should be thinking at a higher level for your age.

I am writing this in a way to poke you hard and to weed out people who can't handle the truth being delivered bluntly.

So, if you are getting offended, that's a good thing.

What you choose to do because of it is up to you—and therefore the cost/benefit will be down to you too, as choice is the problem.

Are you ready for something hardly anyone knows about?

Then read on...

3 - So You Think You Are Safe...

Did you know the currency in the banks is not yours?

Did you know that the shares in your stock account are not yours?

Did you know your car is not yours?

Did you know your house is not yours?

Did you know your pension is not yours?

No, of course, you didn't. You, like me, weren't paying attention when they changed all the laws all around the world so that everything you think you own can be "bailed in" to cover the losses of:

- Your bank
- Your stockbroking account
- Your government
- Your pension company

I know what you're thinking: **That this can't be true...**

But guess what?

It is.

They have set up a system to try and do this to the people, and we are going to live through whether or not they are going to get away with robbing everyone blind.

They did tell you about it, though. Surely you remember the line, "You will own nothing, and you will be happy." I know what you're thinking again... that this is a conspiracy theory.

Oh no, I wish it was.

For ultimate proof of this, we have an altruistic man to thank called David Rogers Webb. He used to run a hedge fund and was very successful. Then, he retired and discovered what they had done.

So, he wrote a book called *The Great Taking*, which he has made available to everyone for free. It's only a short book, I think about 80 pages—about twice as long as this guide. But it is truly shocking stuff. You can get a copy for free on his website. I tried to find it for you, but Google has helpfully pushed it down the search rankings. I am attempting to get this to you quickly, so I won't dig deeper to find it, but you can use Google yourself, or buy a physical copy on Amazon.

Bearing in mind that it conveys the truth that the government currently has a gun to the head of every asset you own (except art and gold and silver), it may just be worth your while confirming that I am not talking rubbish.

But I'll leave that choice to you. Choice, yet again, is the problem.

Do you spend the time to confirm this and have it solidly shape your life, or do you just choose to accept that I am not lying?

Or...

Do you think it's important right now but drift off and forget its significance, so that it catches you by surprise in the future...

Choice and ego are the problems.

The answer to all this is, unfortunately, that the future says you are probably going to be taken for a ride at some point by your government.

So, being able to stay and play in risky markets while knowing they could push the "take it all" button is a skill that needs to be acquired—or avoided.

How do you feel about that?

4 - Why the Opportunity in Gold Is Nowhere Near as Good as Silver

The gold-silver ratio today is 80.299 ounces of silver needed to buy 1 ounce of gold. (Update: Currently it is a whopping 100.53 ounces of silver to 1 ounce of gold!!!)

When Isaac Newton was running the Bank of England, he defined 15.5 ounces of silver to 1 ounce of gold.

But the natural ratio was more like 12 to 1 back then. When I looked at this in 2021, it was closer to 9 to 1, and as of 2023, it was as little as 7 to 1!

What does this mean?

Silver's price has been suppressed since it was demonetized in 1873. This is a contentious point among the experts I'll list for you to check out later. Over the last few years, most of them have slowly watched the obvious truth of this be revealed. But a few holdouts remain, some of the smartest ones too. So, there's always the possibility I could be wrong.

True, me being wrong hasn't happened in a while, but there's a possibility. However, on my probability scale, I put myself as "highly likely" to be right (as usual).

But let's get back to the actual ratio...

Currently, it is 7 ounces of silver to 1 ounce of gold. And for those paying attention, yes I did say the current price ratio is currently at 80+ to 1. So a nice little 11x move coming in there over this bull run (Update: 14x now), and most expect it to overshoot... But I don't want to get you too excited for where I actually think the price of silver could/will likely go... I'll save that for the mastermind.

(Update: When I covered it at the first Mastermind, one attendee said, *"I've got to get half a million into this NOW!"* So if anything I am down-playing the value to you now...)

Back to the point...

With gold, they dig it out of the ground, a percentage is made into jewelry (so it is kept), and the majority is made into bars and coins and then stored underground all over the world (so all of that is kept too, none or almost none is wasted).

With silver, the current supply is circa 820 to 830 million ounces annually. Last year, they used 1.2 billion ounces, and the year before that, they used more than they mined too.

This year, the industry expects to use circa 1.3 billion ounces, meaning a shortfall of close to 500 million ounces. This is now the 5th consecutive year of structural deficits in supply. Now almost all the experts think that this will lead to a price squeeze being inevitable at some point in the not too distant future.

Personally, I think it is way worse than a 500 million ounce deficit, which makes it way better for me. But we shall have to wait a just a little while longer to find out.

But let's look at what happens to it. I went to the extent of asking ChatGPT to provide this info for you:

In 2023, approximately 820-830 million ounces of silver were mined globally. This represents a slight decrease from the previous year due to disruptions in mining operations, especially in major silver-producing countries like Mexico and Peru.

Silver usage across various applications in 2023 is as follows:

1. **Industrial applications:** This was the largest sector for silver demand, consuming around 654 million ounces. Key drivers included photovoltaics (solar panels), electronics, 5G networks, and automotive electrification. Specifically, silver use in photovoltaics reached a record high of 193.5 million ounces, reflecting the rapid growth in solar energy production.
2. **Jewelry:** Silver jewelry fabrication fell to about 203 million ounces, a decline from the previous year. This decrease was primarily seen in India, although demand in other regions remained relatively stable.
3. **Silverware:** Demand for silver in silverware dropped significantly by 25% to around 55.2 million ounces, once again with India being a major driver of this reduction due to high silver prices.
4. **Physical investment:** The demand for silver in the form of coins and bars for investment purposes also fell to 243 million ounces. This was a notable decrease, particularly in countries like Germany and India, where high prices and taxes affected investor behavior.

Despite the strong demand, silver supply fell short, leading to a market deficit for the third consecutive year. (Fifth including this year)

END

Now, I am **not** a fan of the Silver Institute, as they are liars. I know, thanks to Bix Weir, that they are significantly underestimating silver's usage. However, they are the industry statisticians, so we'll go with that for today.

Basically, most of the silver ends up in landfills within 25 years. This is unlike gold, where all the gold produced since the dawn of time remains, except for the odd pot of gold buried by someone. This is unsustainable and will mean with 100% certainty that at some point the price suppression of silver will end. Meaning, those of us who own it will benefit when it does.

What's more is that the price suppression has led to a dearth of new silver mining. Why would you want to go looking for silver when it costs you over a decade of time and \$26 an ounce to get it out of the ground, when instead you can look for gold, take the same decade plus to dig it up, sell it for \$2,730 (\$3,059 now), and have it only cost approximately \$1,100 to get it out of the ground?

This is why there is a shortage of silver and why Mike Maloney has said that one day soon, silver will become "Unobtainium."

So, naturally, the amount of silver mined is trending towards the amount of gold mined. Yet the silver-to-gold ratio sits at over 80... (Over 100 now)

Now, this is where Captain Obvious comes in.

When they run out of physical silver because they are not mining enough, and they are using way more than they mine, then the price of silver **will have to rise**, or there won't be any new mobile phones, TVs, computers, electric cars, solar panels, and basically anything with electronics in it. This is not to mention all of the other benefits we get from silver.

So, as the Captain would say, ***"It's so obvious that silver's price is going up!"***

But it is your choice whether or not you agree. Feel for your answer...

And I almost forgot to say, there are hardly any primary silver companies out there. In fact, there is only one company that is solely a silver-producing company. The vast majority of silver comes as a by-product when mining other minerals.

So, the case for silver is way better than the case for gold.

But briefly on the case for gold: The world doesn't trust FIAT anymore, so it needs something else. After you dismiss cryptocurrency, the obvious contender is gold. Which is why all of the BRICS nations (Brazil, Russia, India, China, and South Africa—plus the new ones, and probably a few more soon) are all buying gold and dumping dollars. (Update BRICS countries now represent 48% of the world's population, and they have currently frozen new member applications)

But it's not on the news... Of course not.

Would the news tell you that your bank might not have enough money to cover your account?
No.

They waited until people were lined up in their thousands outside Northern Rock before they alerted everyone to it. The news is a government-supported entity. The government does not want you knowing that their money (currency) is worthless. *"It's so obvious!"*

I won't waste your time further on this point other than to say the truth of this adage is about to become obvious too: *"He who has the gold makes the rules."*

Would you like to make the rules? - Then I suggest you get 5% of your assets into Gold & Silver before everyone else figures out what you are learning here...

Excited, scared?

Then read on...

5 - Have I Got to Panic Buy? Is It Too Late?

No, not yet. Not at all. You have missed the early gains, though, because gold is up 33% this year, and silver is up 40%. But the mainstream news doesn't want you to know this, because they know you will go and buy some! So, as of now, you have let the government steal more of your money because you weren't paying attention to it. Feel good?

Right now, less than half of 1% of people in the world are in the gold and silver market in any meaningful way, like holding a minimum of 20 ounces of silver. And right now, gold accounts for 1.5% of the total money supply. Silver accounts for 0.02% of the total money supply.

In 1914, 100% of people had 100% of their money in gold because gold and silver were money. For the last 50 years, I think the mean ownership was something like 3.5%, with peaks in 1980 and 2011 spiking up to around 6%. So

just that alone demonstrates a 12x move in prices.

So, it is still very early days, but not too early. And it will be early days for a while yet. But we are at the turning point of a wealth cycle. This is when some asset classes decline, and others (gold and silver) become dominant. For example, this week real estate in the UK hit a 40-year low against the price of gold (yes, you read that right), and we are just getting started.

Since the dot-com crash, gold is up approximately 1,000% (Update: 1,219% now). Whereas the Dow Jones price in 2001 was \$10,199, and it is up to \$43,275 today—a 425% gain, which is good, but nowhere near as good as gold.

(Update: Dow Jones is now at \$37,397 as I type. So a gain of just 367% since 2001. So a loss of 14% since October, and a loss of 16% since it's high in February. Why is this happening, because we are in a Capital Rotation Event, capital is leaving the credit/debt market and going for the security of real stuff gold and silver markets - this happens when confidence is lost at the turn of every cycle. And it is happening now)

But wait, I was told the stock markets were the best-performing asset class this century. Clearly not. ***I think you'd agree that 367% is nowhere near as good as 1,219%!***

But how could all of those financial experts have gotten it so wrong?

They don't understand what gold is.

Gold and silver are money—everything else is credit.

Credit devalues over time!

The current financial system is a debt-based system, and even with their ability to create what they call money out of thin air, they cannot keep pace with the value of gold. They have managed to suppress the price of silver, but gold has clearly broken out of their control now.

(Update: With Elon Musk's discovery of 14 FREE MONEY machines - even I am still processing what this actually means for the value of the dollar and all other FIAT currencies - needless to say, my conclusion will be somewhere on the devastating scale)

The good news is, silver is very soon going to start catching up, and when it does, it will be like a rocket ship. (Update: I wrote that when the Gold/Silver ration was 80:1, now it is 100:1, so think rocket ship on steroids)

Changing the subject, did you know that they can print gold and silver too?

There are apparently 62,000 printed ounces of gold for every single ounce of real gold. This is a number I was told somewhere in my thousands of hours of research. I have no idea if that number is true as there is no way of finding out. We also know that there are at least several hundred ounces of silver (probably 500) on the Comex market for every real ounce of silver.

The Comex is where the price of Silver is currently set. Us mere mortals can't actually buy Silver from the Comex, as we are not the 'chaps'. We have to buy it from companies that buy it from the 'chaps'. So we get to pay more thanks to their rigged market.

The Comex was set up in 1973 to manage the worldwide Silver market and I could write for ages on this demonic entity. But I won't, as this entity's days are numbered. However, there is the Shanghai physical gold and silver market which for the last 6 months or so has been selling physical silver at a price of between \$3 to \$5 higher than the worldwide price of silver. In other words, they are suppressing the price, but when real world people buy physical silver they are happy to pay more.

Currently, the chaps who can buy from the Comex and buying all they can and shipping it to China for the £3 to \$5 spread... Yep, what could possibly go wrong with allowing all the west's real money to be sold to China for chump change. How do you feel about buying some silver just to protect it?

(Update: Currently there are 5½ buyers of Silver for every single ounce of Silver in the Comex vaults. Think of it like musical chairs, there are 5½ people playing, and there's only 1 chair available for when the music stops! How it is surviving each month now is, one of the big banks is selling their own silver each month to keep the Comex market from defaulting - how long would you be happy to keep giving your real money away before you said no?)

So what a lot of people who are in the less than 0.5% of people invested in the precious metals market do is they buy Silver in paper form through an ETF called SLV and GLD for gold. They have their money in their stock accounts, pension accounts and they feel safe that they own gold and silver.

But they don't.

They own the dollar price of the number of gold and silver ounces they own. In other words written in the terms and conditions of these funds is their ability to 'settle in cash' instead of ounces.

So one day, which is coming soon, the price of silver and gold will run away. And the ability of the Comex to supply the silver first, but gold's not miles behind will have run out. Then they will settle everyone for cash and close down. Having supposedly done nothing wrong.

Then all those people who think they own gold and silver will wake up to the fact they don't. When that happens (not if), when that happens that will begin a run to precious metals like the world has never seen.

This is what I mean by getting out in front of the wave, then riding it.

So in conclusion to the idea of physical ownership of Gold and Silver, basically you need to be in it to have a prayer of handling the coming devaluation of the FIAT currency world. Something which can be witnessed as fact by simply going into a shop or shopping online.

Again it is your choice as to what you think here. ***I'm sure you can hear your ego yelling at you that I am OBVIOUSLY wrong, but can you feel your intuition whispering to you?***

So there's your first position in gold and your first position in silver sorted.

Side note: How this all ends in my opinion is with us all going back to gold and silver and then through the use of the blockchain

we are able to spend our money without carrying physical gold and silver around. But we are a LONG way off that time.

So what do you think?

Can you see that your currency (money) and your assets are being slowly taken away from you with stealth tax called inflation? The government is stealing from you and saying it is someone who is trying to help you's fault.

And that the way to stop this dead in it's tracks is to insure your current wealth is protected by real physical gold and silver?

Or do you think I am talking hogwash...

I recommend feeling for your answer instead of that voice attempting to drown out wisdom...

Now if the opportunity of making 1,000's of percent return in Gold and Silver bored you, let's spice it up by showing how to make 'real gains' too...

6 - A Risky Investment Sector - Gold & Silver Mining

There is a way of getting much more leverage on owning gold and silver... But it is not for the faint-hearted.

I will attempt to keep this as short as possible so as not to bore you with it. However, there are fundamentals you need to grasp to truly understand the potential of this market sector.

So, I will cover those, but first, I'll explain why this is so good **if** you manage to get into it at the right time.

The precious metals mining sector is considered very risky.

And oh boy, are they correct! Mining is a really shitty business!

Anything can happen with a mining company that knocks investor confidence. Sometimes I think it can be as little as the CEO coughing at the wrong point on a Zoom call, and the market drops their stock by 5%.

I'm exaggerating, but as one of the experts I follow, Dave Kranzler, said recently, *"Right now, any mining stock showing any single sign of weakness is taken out behind the woodshed and shot."* This was from his *Mining Stock Journal*, the first source I began following in this space, and he has taught me a lot and helped me make a lot of money. But his is a 'buy & hold' strategy, mine is not, because I like to get paid to hold stocks, and I am not talking about dividends.

However, I digress. The precious metals mining stock sector, up until February this year, was **the most hated** sector I'd ever seen. ALL of the experts said the same thing.

Yet, somehow, I'd still learned to make money in it, even in a falling market. But we're not here to boost my ego, so I'll save that for when we're having a beer in Hampshire.

The time when Dave said that, was when the whole market sector was unloved. But then there are also horrors like a bleach pit leaking, a mining accident killing someone, and then 20%+ being knocked off the stock price before you've even heard about it. Nice thing to see when you log in to your trading account... NOT!

Then there's the planning approval being turned down, which can halve the value of the stock!!! Then there are the drill results that come back poor or terrible—an easy 5% to 15% knock off the price. Plus, you've got the more obvious 'earnings report' letdowns. If they happen on the wrong day when the market is moving down, they can turbocharge a share price drop from 3 to 7%.

In my first year, I had one company go from a \$1,000,000,000-ish valuation to worthless. Fortunately, I only lost about £1,000. The main sole investor lost circa \$20 million on that one and is still licking his wounds, even though he is a billionaire.

Subsequently, I bought shares in the company that acquired their assets and have made a lot more than my money back. I think I will go on to make as much as 1,000% on my investment/speculation in the next 24 months. However, there was no guarantee of any of that happening when it went broke.

What I am attempting to do here is scare you, as this is a very scary sector—not for the faint-hearted. ***And I don't want anyone thinking of coming into a mastermind with me who doesn't have the mental fortitude to handle a loss of 5% of their entire portfolio without a smile on their face.***

No, none of us like that, but it comes with the territory.

To use a non-politically correct term, this really is not for girls, and especially not for socialists!

Not for those looking to be in a mastermind group who can't accept that loss is part of investing. Any serious trader will tell you if you win 51% of the time and lose only 49%, you can make money. If you can make money 70% of the time and only lose 30%, then you are world-class.

Something which I am very pleased to say I am currently exceeding, but I'll get on to that later!

There is, of course, a much safer way to invest in this sector: buy a few good companies and forget about it for five years. This was more or less the advice (not that it was advice, of course) that I gave when I wrote the Bitcoin book. To remind you, I said, buy 5 Bitcoin, put it in a wallet, and forget about it for five years.

If someone had done that, they would've invested \$65,000, which at the low point would've been worth approximately \$17,000. After five years, it would have been worth approximately \$110,000. And today, it would be worth around \$335,000.

So that simple advice has been wrong and it has been right. Since 2020, it has never gone down to \$17,000 again. The main trend for Bitcoin was up, and it is the same here in the precious metal stocks. The main underlying trend is up, and so you can pick the good ones and just come back to them in the future. If they are not right then, then come back a couple of years later, and they more than likely will be.

However, when I chatted about Bitcoin and wrote a book on it, I had been in it for approximately 6 months. I knew next to nothing about chart technical analysis, I knew only some of the digital currency world, and I knew nothing about the power of the deep state to control that world.

Instead, I have lived this market almost daily for 4.5 years.

I can read technicals, though not to the professional level, but often my ability to time beats the people I pay to listen to on timing and momentum. Plus, I understand way more about the macro world than I did back then.

More importantly, I have spent 4.5 years being held accountable by the members of the Rational Thinking Webcast and, in a recent call, I asked them to detail all I have ever called wrongly.

Sometimes I would get future temporal stuff too early, and being too early can, at times, be the same as being wrong, so that is always in my mind. But basically, the only thing they collectively agreed I've gotten wrong over the last 4.5 years is my choices of what shirts to wear.

You make of that what you will.

Back to the point, the mining sector is scary, but it is manageable when you understand human (market participant) psychology, and you can read the tea leaves as to what is happening and will happen in the world.

Don't worry, I'll be getting to the juicy stuff soon, now I've done attempting to scare you off...

7 - Getting to Know the Different Types of Companies You Can Buy Into in the Precious Metals Market

As a sector of the stock market goes, this is what is known as **tiny**. As an example, Apple could buy every single share of mining company stock out there with their current cash reserves.

"We are talking small", as 'Arthur' would say. Right now, the market sector is hated, and it has been hated for years. Apart from a few good peaks in the mid-2010s and 2020, the market is way off its all-time highs. But when it stops being hated and the vast sums of money in the remainder of the stock market notice the extraordinary profits we are making in the precious metals...

Well, it is like an airport full of people attempting to squeeze through one little gate. Can you feel it coming yet?

There are companies like Barrick Gold for example ticker GOLD, that is trading today at \$21.10. When in 2011 it was trading at \$56.01. So there's a 300% gain to be had just getting back to previous highs, let alone inflation adjusted highs...

But wait, there's more... That was when the All-Time High (ATH) for Gold was \$1,920, roughly adjusted for today would mean Barrick would have to get to

\$79.00 per share just to catch up with the price it was in 2011. Plus inflation!

Are you getting this? Are you feeling this yet?

You have stumbled across the fabled thing known as 'opportunity.'

But let's not forget, Barrick has a lot more Gold in the ground now than it did in 2011...

Back then there were companies being valued like this, their gold in the ground was valued at 1/3rd of the value of Gold, so say \$635 per ounce in the ground was part of the valuation. Another \$635 to dig it out of the ground and refine it. And the last \$635 was profit.

Have a guess at how low I am able to buy Gold in the ground for, today, when Gold is selling for \$2,730... (\$3,078 now)

Go on, have a quick guess. See if you can feel the value today...

I've written this next paragraph to give you a moment to guess and see if you can get anywhere near, so right now I am wasting your time. But I think you'll understand why when I reveal it to you.

Some of the stocks I am buying, I am paying less than \$5 for gold in the ground. Even the good ones I would guess at \$30 to \$80 for gold in the ground. I recently purchased a company called Snowline Gold (SGD ticker) and when I bought it, they had stacks of gold. They are still a few years off a mine, but they have a massive amount of gold in the ground, and that's currently valued for \$40/ounce (and they just found a lot more).

So, somewhat shy of the 2011 1/3rd valuation. Today, that would be circa \$910/ounce. So that means, as Rick Rule loves to say, if past were prologue, then I have a return of 2,300% waiting for me at some point in the future.

Are you getting this? Are you feeling this? Do you think I am bull-shitting you to sell some places at a mastermind, or can you feel the opportunity?

And remember that is with Gold at prices today which I think are going to be blown away in the future. That's my and now most of the analysts' opinions of course, and we can ALL be wrong. I just don't think we are.

*"I and my friend Doug Casey
have accurately predicted 17 of
the last 3 recessions."*

Rick Rule

Can you imagine what would happen if gold went to just \$4,000? Something which almost everyone in the industry now looks at as inevitable? What about when Silver gets back to just its previous All-Time High (ATH)? Which is \$50!

But why do you make so much money when the mining stock sector works?

Simple. Let's say you are producing silver for \$25 all-in sustaining costs (a little bit of industry jargon there, thrown in to impress you). And you are selling it for an average of \$7 profit if you are lucky (\$32 has only just been possible, so not really realistic, but I'll say it is for this purpose). So your company is worth assets + profit from the sale of silver.

Let's say it's valued for \$500,000,000 today with silver at \$34. If silver sells for \$50, then you are making \$25 instead of \$7ish. That's an increase of 357%. So your stock goes up (when the market feels like it) by 357%. And you have your first "3 bagger"! Another favorite bit of industry slang jargon.

My biggest win so far has been an 11 bagger! 1,152% gain to be precise. Unfortunately, it came about following a sale of another company that spat me out some shares worth about \$30, so it could've been better! But hey-ho, it showed me what was possible. I have had a lot of 100% gains; just last week I had two, but prior to that, I hadn't had any for 5 or 6 months. Remember, all of this is happening in a down market that has only just turned positive.

Now that I have appropriately whetted your appetite... I'll cover the bits you need to know if you venture into this minefield without me.

There are different categories of companies. I won't cover them all, but here's a list, and you can research further using Google if you really want to dig in:

- Major (we produce loads of gold and other metals)
- Emerging Major
- Royalty Streaming Company
- Mid-tier Producer
- Emerging Mid-tier Producer
- Junior Small Producer
- Near-Term Producer (we are about to start producing metals)
- Junior Emerging Mid-tier Producer
- Late Stage Developer
- Junior Near-Term Producer
- Junior Late Stage Developer
- Project Generator (we're trying to find some gold and sell the land to developers)

I'll cover a few: The biggest major precious metal mining company is Newmont (NEM); today their market cap is \$66.3 billion USD. They have multiple producing mines. The better quality of mine, the better the producer, the better the company.

Other examples of Majors are Agnico Eagle Mines (AEM) \$43.23 billion USD, and Barrick Gold (GOLD) \$36.81 billion USD.

You could say those sorts of companies are the safest plays in the industry, but that would be true, and also not true. Because a problem in one mine can take the whole share price down for sometimes no reason at all.

A safer play is the Royalty Streaming companies, such as Wheaton Precious Metals (WPM) \$30.58 billion USD, or Franco Nevada (FNV) \$25.77 billion USD, or Royal Gold (RGLD) \$10.02 billion USD.

The royalty streaming companies are the safest of the lot, but are still not safe. Their safety comes from their business model. What these companies do is they loan smaller companies the money needed to fund their drilling and mining. In return, they get an NSR (Net Smelter Royalty) of some level of percentage.

So let's say a company like Alamos Gold (AGI) wants to build a mine but they don't want to borrow and make their balance sheet look bad. Instead, they could ask Franco Nevada for a \$200,000,000 loan to build the mine, and in return, FNV gets a 2% NSR.

This means for every 100 ounces Alamos pulls out of their mine, FNV gets 2 of them forever. This means that FNV has an income which could run for years all for the cost fronted at the start. They have no inflation issues—that's all covered by Alamos. FNV just sits back and pockets their 2% cut. Which, as soon as the mine is up and running, can easily be borrowed against should they want to. Or sold to someone else.

Not only that, but let's say Alamos decides to do a bit more drilling (at their cost, not at FNV's), and they discover a load more gold at the same mine site. FNV didn't pay the millions to drill, they didn't pay for all the drill holes that cost Alamos millions. They don't pay to dig that gold out of the ground either. But they still get the 2% NSR on every single ounce Alamos found and dug out.

Nice business model if you're cash-rich. These Royalty streaming companies can run with a handful of staff and produce net profit in the high 80%'s at times.

The problem with these seemingly 'gifts that keep giving' is they are never going to make 5 to 50 times return on your money. Which is what is possible the further you go down the value scale and the further you go up the risk scale.

Personally, I love the junior producers, near-term producers, and junior near-term producers. These companies that value between \$25 million up to a few hundred million are potentially ridiculous profit makers.

Difficult to believe? I understand that, especially given how unloved the sector is now. But there have been a few times when returns like these have happened, and I think, or rather I know, we are either in one of those times now or we will be in it within the next 18 months.

For example, in the 2009 - 2011 price surge of gold and silver, from memory, the average return on investment for all companies within the precious metals sector was approximately 1,200%. Not bad, huh?

But wait, there's more (as George Gammon would say).

In the 1971 to 1980 price surge, the average return was about 2,800%. That's average. There were companies in both eras that went from \$0.05 to \$50, and even more than that.

And that is where skill, and luck, play a big part.

Over the last 4.5 years, I have evaluated around 400 companies, and I have found around 250 that I would be happy to invest/speculate in. But that's way too many to manage.

What I was told when I first came into this was that you want to have at least 25 to 30, and preferably 40 different companies from a range of the categories above. This is so that you spread your risk. You never want more than 5% of your fund invested in any single name. This way, if the company loses 50% in value as they have their permit turned down, then your downside is 2.5%, not 50%.

This is good risk management, but you can get it better than that if you increase the number of stocks. But if you do that, you don't have so much time to keep up to date with what's happening in them.

Rick Rule, the famous commodity investor, often says you must devote at least one hour a month of research into each of the companies you invest in. I don't do that, but please don't tell Rick.

I have never worked out how much time I spend on each. For some, it is virtually nothing as they are not in play; others can take hours per month. I follow what interests me and trade on a technical basis. Once I like a company, I add it to my must-own list. This currently has about 150 names on it. I am usually invested in about 100 to 120 of these. But sometimes, that is with only \$50 at times. I currently have 57 meaningful-sized positions. The biggest is currently 10% of my portfolio. However, I spend hours looking at this company regularly. I have plenty with 2% positions, and I spend a few minutes a month on them, sometimes even less than that.

So, bigger position = learn more about the company. Why do I work this way? Because I like to sleep at night.

If you've heard enough and want in but have no interest in joining us in Mexico, or simply don't have the funds, then here's a mid- to long-term buy-and-hold list that you can use and ignore at your own peril.

What I am attempting to provide here is some great long-term upside with risk mitigated in a lot of ways, which I don't have time to go into here. However, as I said, I can be wrong, and something can happen to each of these companies. So, you are responsible for your own due diligence.

NEM - Newmont: Pretty much can't go too far wrong. It won't set the world on fire, but when the market sector moves, money will flood into this name as it is the biggest by far.

AEM - Agnico Eagle Mines: Probably the best all-round major precious metals company in the world. Money will pour into this too—into any major, in fact, as there are not enough of them.

WPM - Wheaton Precious Metals: Extremely good company. I expect dividends to increase a lot when the (just-starting) company acquisition process has run its course.

Side note: Right now, big companies are buying smaller companies because they are very, very, very cheap, and the big companies have lots of cash because the price of gold has gone up and up. They want to replenish their stocks of gold in the ground before the prices go up further.

FNV - Franco Nevada: Probably the best company in the precious metals sector. Because it is a Royalty Streaming company, its risks are very, very low. But this year, it took a major knock in price, going from \$145 per share down to \$102 per share. As I said, nothing is safe. Even the best of the best can be knocked, which is why a 5% max allocation is not just a good idea, but a great one.

GFI - Gold Fields: They just bought another one of my companies, which was Osisko Royalties (I owned both at the time). When they bought it for a bit too much money if you ask me (but then that will likely prove to not be the case), they paid \$400/oz in the ground for it. So top heavy. But the day they bought it, my shares in Osisko jumped 67%. Which was nice. My shares in GFI dropped 5%. So I sold my OSK, put it into GFI, and GFI continued to go down. So I stopped, looked at GFI, and decided the market price was wrong and that there was massive value there.

BTG - B2 Gold: these guys are great. Great management team, producing a lot of gold. Massive amount of upswing left in their price. They probably have one of the best gold assets in the world, and I think they currently have 4 producing mines. The more mines you have in different locations, the less geo-political risk you have (something which again I do not have time to cover here, but Google can tell you all about it).

FSM - Fortuna Mining: one of my favourites, currently my largest position. Lots going on which confuses the market as to its true value, which is working in my favour as I am able to buy value at a discount here. Thanks to YouTube channels like Arcadia Economics and Dave Kranzler originally recommending it, I have watched how the CEO runs the company and I love it.

SVM - Silvercorp Metals: is a big silver producer, however, the smallest company by market cap on this list. This was another Dave recommendation, however, I was already a big fan of SVM.

DSV - Discovery Silver Corp: less than half a billion market cap, but should get final permitting for production soon. They have simply massive reserves of silver and are expecting to produce around 37 million ounces of it a year for at least 10 years. So you can imagine this one's potential over the coming 10-year bull market, which we have only just entered.

JAG - Jaguar Mining: this is a small mine, but they recently found they had double the number of ounces in the ground thanks to their recent drilling campaign (which is why their price ran up a lot recently). So they are producing and can double output for the same cost. They also have other mines and mills which are on care and maintenance (stopped producing as the gold price was so low, but it isn't anymore! So what do you think is likely in this company's future...). They are trading at 60% of what their high was in 2020, they have a lot more gold now, and the price of gold is at least 35% higher. So this looks safe-ish too. But is currently experiencing a little pullback due to recent growth of nearly 250% off the bottom.

I'll throw in a couple of juniors which are way more risk, so remember, do your own due diligence. These are on my must-own list too.

HSTR - Heliostar Metals: \$143 million Canadian market cap. They now have 3 producing mines, which has meant the price has run up recently, but it is still early days. This is easily a 5 to 10 bagger in my opinion.

LIO - Lion One Metals: \$94 million Canadian market cap. Stacks and stacks of gold, and they keep finding more. Will probably end up being bought out before it becomes a full-producing mine, but let's 'hope' not as this one will print extraordinary returns. They are now in limited

production which will be covering their ongoing drilling. Which means no more share dilution (a common problem in the junior sector). The CEO owns 10% of the company, which is a very good thing as he'll want to maximize his value. Much better than a CEO who doesn't have any skin in the game. This CEO has also successfully sold 3 other companies, so it's feeling safe-ish to me. Three of the experts I follow also love this one, Bob Moriarity, Dr. Quinton Hennigh, and of course Dave Kranzler.

Now, if all that little lot still sounds a bit too much work for you, then there's another way to play this market. You buy one of the gold/silver funds available.

These funds contain around 30 different companies in each which means you spread your risk further. You can get the list and see what percentages the funds have invested in each just by searching online.

The four funds are GDX, GDXJ, SIL, and SILJ – descriptions below are taken directly from Tradingview.

- **GDX - VanEck Gold Miners ETF:** GDX is one of the most popular funds in the global gold-mining segment, a trading powerhouse with deep primary, secondary, and derivatives markets. Following a 2013 overhaul of the fund's index, GDX is no longer limited to US-listed firms, nor does it filter out firms that have hedged their gold exposure with derivatives. In addition, it includes firms mining other precious metals in addition to gold, so it's not entirely pure-play gold miners. GDX includes all the major names, but the fund's broader take on the gold-mining space means that the big firms get less weight than in our neutral benchmark. As an industry benchmark, GDX falls a bit short, but it's still hugely popular.
- **GDXJ - VanEck Junior Miners ETF:** GDXJ is closely related to GDX, in name, exposure, and history. The index covers global precious-metals-mining firms that generate at least 50% of their revenues from gold and silver. Junior gold miners are selected by market cap. It may include small- and midcap companies whose revenues are expected to grow as they further develop. To ensure diversification, single stocks are capped at 8%. Constituents are reviewed on a quarterly basis, where a sector-weighting cap factor is employed to ensure that 80% are determined as gold stocks, and silver stocks are limited to not go above 20%. The underlying index methodology has changed over time. In June of 2017, the index rules were modified, expanding exposure to include larger companies.
- **SIL - Global X Silver Miners ETF:** SIL aims to track the equity market performance of global companies involved in the silver mining industry, including those engaged in silver mining and/or closely related activities such as exploration and refining. Constituents for the underlying index are derived from a ranking system based on their average daily trading volume in the last three months expressed in USD. Its portfolio is generally composed of 20-40 stocks and is also market-cap-weighted (subject to caps). The index is adjusted semi-annually.
- **SILJ - Amplify Junior Silver Miners ETF, SILJ** tracks an index of smaller stocks from around the world that derive revenues, have market share or are engaged in silver

exploration/development. To determine silver revenue percentages, securities are assigned a Metals Focus sector (e.g., Project Development, Silver Mining, Streaming, Diversified Mining, etc.). The fund calculates a theme-adjusted free-float market value for each security based on their market cap and Metals Focus. Pure-play companies are overweighted after initial weights are determined based on the security's theme-adjusted free float market value divided by the aggregate value of all securities. The portfolio is then adjusted based on market cap, subject to constraints. The index is reconstituted semi-annually and rebalanced quarterly. Prior to Jan. 29, 2024, the fund was called ETFMG Prime Junior Silver Miners ETF that tracked the Prime Junior Silver Miners & Explorers Index. Prior to May 3, 2024, the fund tracked the Nasdaq Metals Focus Silver Miners Index.

Now when a newcomer comes into this sector, all the experts recommend buying these ETFs. Yet they don't buy them themselves...

Big funds buy these and people who want exposure to the sector without any work. I've never bought them myself as frankly the potential returns are nowhere near as good to me as what I can make investing/speculating in individual stocks. However, my risks in doing this are way more than buying into these funds, so you get to make your own minds up.

Obviously, this is a tiny fraction of what I know about these companies and the market sector. That's why there is going to be 7 full days at the Mastermind, and stacks of time outside of the room to go deep on loads of juicy gems I do not have time to cover here. After all, I am attempting to squeeze the gist of 4.5 years of research into a 40-page guide...

If you'd like to learn more about the Mexico Mastermind, then [click here](#)...

But before you get carried away buying those wonderful companies, you need to know a bit more about risk...

8. Some simple risk management

Managing risk: decide what you want to get from a stock before you buy so that you'll know when to get out. Simple stuff, right? Maybe. Maybe not.

Firstly, how much of your net worth are you going to invest with? I cannot remember what percentage I first started investing/speculating with in the precious metals sector, but I think it was less than 5%. It may have been up to 15% of my liquid net worth, but I simply can't remember. I have the advantage that 5% is still a lot of money. If I had less money, I may have played with a lot more. This is going to be your choice and requires thought...

Now let's say you know how much of your 'pot' you are willing to play with and your trading account is funded.

I suggest before buying any stock, you consider the following:

1. How long do I plan to hold the stock for?
2. What is going to change within the investment for the value to rise?
3. What might be a range of fair values?
4. How will I know if my information is right or wrong?

"The nature of investments is you endure many 25 to 30% losses on the way to the one that gives you 1,000% gain. It is important to cut your losses when you are wrong and not let them run."

That advice came from watching Rick Rule. It's good advice. However, I got fed up with the 25-30% loss part. Rick often talks about being 50% down before later making huge profits, yet says to cut losses at 25-30%, so maybe he is not following his own advice—but don't tell him I said that. He does things this way because he is a fundamental investor. He buys value at a discount and is prepared to wait until the rest of the world realizes the value he has seen.

When a stock drops 50% in value, Rick checks whether his original premise regarding the investment is still sound. If it is, then the investment he is in is now being offered at sale prices. So he buys more. If the premise has changed and he no longer likes the trade, he sells and takes the loss. This is a professional investor.

This is being grown up and understanding the time cost on your money. It was better to take your losses on the Japanese stock market and invest in a growing market elsewhere than it was to sit still and wait the 33 years until the market recovered.

Taking a loss is part of this business. I have taken losses and not learned this lesson at all, and now I take losses, albeit only small ones, and am pretty sure I am learning the lessons. I also have learned how to have multiple winners for every loser.

Well, I have been at this for 4.5 years, and it only took me 6 months to become a multi-millionaire in real estate investing from a standing start. So, 4.5 years to me is taking a LOT longer. However, I fully expect this to make me richer than real estate...

And I am in much less of a rush now as I can feel when massive success is close to being achieved. And boy do I feel it now!

If your trading account has the ability to put stop losses on and you are uncomfortable with taking losses, then that is another way. I don't use them; I pay attention daily instead. So that is down to your level of comfort and your time available. If I were leaving stocks in play and not looking at them, then I would use stop losses. Or maybe I wouldn't on my favorite stocks—I would have to decide at the time. Do you get it? It requires thought.

The reason for the mastermind group is so that there are many people watching the market, waiting for a change that signals getting in and getting out. For more details on grabbing one of the 25 places available in June, please [Click Here](#):

But what about the biggest hurdle of all? What's that, you ask? Well, your mindset, of course—that is going to make you the most amount of money or cost you the most... I cover that in the next section.

9. Attaining and Maintaining the Mindset Required to Handle Investing/Speculating in this RISKY Sector.

Playing in this world is all about confidence. ***“Confidence comes not from always being right but from not fearing to be wrong.”***

So what I have given you here is a Treasure Map. I have told you that the Treasure is located on a specific hilltop. So I have told you where it roughly is, to say within the size of a football pitch.

This guide has narrowed it for you from the size of the world down to a football pitch. From that level of guidance, it is down to you to go and find where the Treasure is. If you want the X marks the spot, then you'll need to ante up and join me and my friends in Hampshire, England in about eight weeks time.

But if you put the effort in, then you can still find it, and you will get lucky. So as you take those actions and as you keep digging up that pitch, you will attain confidence as a by-product.

Why? ***Because you know the Treasure is buried on that pitch, you can feel it, right?***

All you have to do is keep digging, and you'll find it. Nothing you dig up from that field will be wasted, as it is all helping you attain a state of mind where you know you are in the right place. All the data that comes to you from digging up the pitch is silently building up the most important thing of all, confidence.

Before you even start digging though, your ego will attempt to tell you that I'm keeping something back and it can't be that easy. And without the last bit he is keeping back, that you know you won't be able to do it. What assholes our egos truly are.(or... what an asshole our ego truly is)

The truth is, that is utter bullshit.

And you, the real you, knows that right now. You know it, you can feel it.

However, right now isn't important. But it will become important as you step out on your journey to riches through precious metal mining stocks.

(Update: Hardly anyone who attended the Mexico Mastermind had actually bought themselves any physical Gold or Silver... Meaning, no one realised how important it was until I went through it in detail, then they ALL got it. So bearing in mind many more of you won't be joining me than will, so I want to make sure I emphasise to you now - getting physical Gold and, or Silver in your possession is of unimaginable importance - no matter what your ego attempts to tell you - There

you go, I've spelled it out, but it is your choice as to whether you take any action about it, and choice is always the problem)

If you don't have the money to buy the stocks for yourself, then how about considering how to get the money, and maybe doing it with someone else?

Thinking outside of the box made me tens of millions in real-estate. I expect over time to make way more than that from this market sector, and with a LOT less effort.

If you do have the money to buy the stocks for yourself then ***you have the momentum problem!***

That is, from where you are now to actually buying stocks lies a series of hurdles you must first clear to get to the end goal. From now to each hurdle, your ego will do all it can to distract you from something which you know will work. That's IF you can be arsed to focus on it.

Which means choice is the problem again.

Do you choose to devote the time required to get over each one of those currently hidden hurdles? Are you prepared to sit and contemplate a plan to get over all those hidden hurdles? Or are you going to swan off and forget to do it... What does your ego think? What do you feel though, as that is what is important.

Choice, and choice is the problem. But so is unconsciousness. By not being intimately aware of your mind's ability to distract you, ***then how can you possibly clear all the hurdles?***

But let's say you get over those hurdles. I would guess at least 90% will fall before they get to buying an actual stock, let alone coming up with a plan to learn more. (Update: I underestimated this, my guess now is 99% of you reading this will fail to take adequate action from it - because it is in are nature to ask for answers, ontology delivers them, and then free will allows us to ignore them - that's the catch right there, choice is the problem)

So you are in the 1% and you have your stocks, things went well immediately, you were up 15% and feeling like an expert. But now the market has turned, interest rates have gone up, and the price of gold has fallen. You are 20% underwater...

How's your confidence doing now?

How do you feel about all this?

How about this scenario: you survived all the early losses and your stocks are now up an average of 300%.

You are getting really nervous now as this is real money, maybe life-changing money. Can your ego handle you hanging in there and waiting for them to go up 1,000%?

This exact scenario, believe it or not, is what costs most precious metals investors the vast amount of the profits they would've had if they understood the market and their ego.

Without a mastermind group to help, it will be essential for you to stay up to date on an ongoing basis to avoid being caught by this one. Frankly, that is one of the reasons why I am doing this—I want more eyeballs looking at things the way I do and alerting me as required.

Now I've given you a few of the tiny but massive mindset hurdles which are waiting for you to uncover.

That's IF you manage to get past all of the initial hurdles of buying your first stock.

In my previous life as a mindset expert, I had to work with people who were learning to trade, and there really are all sorts of mindset hurdles which come out of nowhere to stop you from starting.

Hurdles that get you to quit too soon. ...And keep you in too long.

I can't help everyone with all those future problems as frankly I am not prepared to. But I am prepared to help a few.

If you would like to not just know where the football pitch with the treasure buried in it is located, but instead you would like to know precisely where to dig, how deep, and also how to protect the treasure you discover buried there...

Then you are exactly the sort of person I am looking to work with at the Mastermind and ongoing for at least a year afterwards.

For more information on the Mastermind in June, [click here](#). Or carry on reading as I've got loads more goodies for you yet...

10. Here's just some of the resources I have used and continue to use that have enabled me to get this far

Some of the people I listen to regularly and sporadically regarding the economy and money. I mainly listen on YouTube. These are in no particular order, or preference. I find each of them adds a little or a lot to my thinking. I can guarantee I've missed people I trust off the list too.

- Rick Rule
- Jim Rickards
- Mike Maloney
- David Hunter
- Maneco64
- Rafi Farber
- Alisdair MacLeod
- John Rubino
- Eric Sprott
- Chris Vermeulen
- Andy Schectman
- Marc Faber
- Jeffrey Tucker
- Tavi Costa
- David Morgan
- Lawrence Lepard
- Willem Middlekoop
- Gregory Manarino
- Jim Rogers
- Bob Moriarty
- Peter Schiff
- Simon Hunt
- Andrew Maguire
- Bill Holter
- Jim Sinclair (of course, sadly deceased)

Some of the people I pay to listen to:

- Jake Bernstein
- Dave Kranzler
- Vince Lanci
- Jim Willie
- Francis Hunt
- Future Forecasting Group
- Michael Oliver
- Don Durrent
- Bixx Weir

- Tom Luongo
- Michael Pento
- Mike Maloney
- John Feneck

I am not an expert; they are.

But I have the ability to listen to experts and take away key parts of their expertise to formulate my own plans. On the subject of money, that is what I have been doing for the last 4.5 years. This has ended up with an ex-city desk trading manager saying I am an expert. But I'll never see it that way. I just know how to use these skills to profit from what's coming, and sprinkle a little fairy dust of my own on it to exponentially increase my returns along the way.

You're getting close to the really good stuff, keep reading...

11. Conclusion of the basics

Now I'm going to stop here on what I consider the boring stuff. It's boring to me, but it may be fascinating to you. But my goal here was two-fold.

If you remember, my first ulterior motive was:

1. Explain the opportunity that exists for you to take advantage of a wealth cycle change that is finally happening now (it is called giving without expectation, and the Universe has always rewarded me handsomely for it. I have found making conscious people money a very good way to make long-term friends).

So I trust I have given you enough to whet your appetite and more than adequately rewarded you for your time spent here.

For the remainder of this guide, I am going to be explaining the benefits of my second ulterior motive, which was:

To convince you to take a look at joining me and some friends in Hampshire, England, that is happening from 12th to 19th June 2025.

It is happening in order for me to build a mastermind group in which we can collectively help each other out regarding mindset support and opportunity notification on an ongoing basis, ***thereby maximizing the gain of this once-in-a-multi-lifetime opportunity.***

This opportunity is only available to people with at least \$50,000 to invest in precious metal mining stocks (more is better), who must not be socialists, who must not be woke, and who must either have or be prepared to learn the mental strength and invest the time needed to learn how to make the profits mentioned so far look like a bike with training wheels on.

The remainder of the guide is going to explain what's possible and how I'm doing it. I'll include some recent results and attempt to explain fully what I am offering to teach you.

Let's begin...

12. Turbo-Charging this once-in-a-lifetime opportunity

My goal here is simple: to turn some of you into very talented amateurs, like me. ***Who just happen to be in the top 2% of traders in the world!***

The previous way of owning the mining stocks, which I just showed you, and participating in the next bull market, was what I figured out by the latest mid-2021. I call this the homework basics.

You've got to know which companies are good, where they are on their journey, and what risks you can take with them.

So this is where you are not a complete know-nothing newbie, but you know enough to make some serious errors unless you leave things alone and let time reward you.

I wanted a lot more than that!

And I want to show you how you can get it too!

Personally, not being an instant success at something sort of went against the grain with me, as I have always been able to enter a business or sector and make the experts in it look foolish. And I like that. It feeds my Generation X rebellious spirit, and I find it very amusing.

Essentially, it's all a game to me, and games are supposed to be fun.

The better you play the game, the more fun you have, as you end up beating people who are clearly better than you at it.

I've spent a lifetime doing this, and I love it.

When it's a game, it's not work.

When it's not work, it's fun.

When it's fun, I don't get bored.

When I don't get bored, I get better at the game.

However, something strange happened when I got into this mining stock investment idea. I didn't become good at it very quickly, which was somewhat annoying, to say the least.

If you had told me at the start that it would take a little over four years to get really good at it, I probably wouldn't have started. At the time, I was doing pretty well at becoming an expert in a new career that had been forced upon me because of the lockdowns, as you'll see later on.

So, here's my emotional timeline over the last 4.5 years. **As you read it, it starts from the top left, then goes down, and then up, following the peaks and troughs in the market.** The chart I've used is GDXJ; it's just a representation of what went on and the emotional highs and lows.

One last thing before you look at it, **remember you are looking at a mindset experts chart.** I have trained numerous traders regarding mindset management. But I had never traded before 2020.

My somewhat emotional journey:

(read starting left top, then go down and up following the market trend after Mr Wonderful joins in)

I share this with you so that I give you no delusions about my level of expertise. I don't think I am an expert in any way, and I don't want you to think I am either. Plus, I never intend to be one, as that would require far more detail than I am prepared to learn and articulate. Frankly, I find too much detail irritating now. I'd rather have friends fill in the blanks for me on the details, and I sprinkle the fairy dust on.

Most importantly, I don't think you or I need to become experts—**just very talented amateurs.** Right now, I'm pretty sure I've become a very talented amateur. Between now and February next year, I'll confirm this, and I expect to be even more talented by then. (Update: Mission accomplished)

I would prefer to give it another year before offering this to you, as that way, I'd be even more certain of what I know. But, alas, the market is moving, and we must strike while the iron is hot.

Here's a brief list of my careers and my rough level of expertise in each one:

- Cabinet Maker - qualified, I would probably be considered an expert in this
- Double Glazing Installer - Expert, I didn't just beat everyone, I did double the best of the rest
- Window manufacturer - not an expert, but beat all the experts
- Real estate investor - not an expert, talented amateur, but beat the experts till the world changed and taught me a lot! Believe it or not, but it humbled me.
- Best-selling Author - talented amateur at best, but speed writer for sure
- Real estate investor training - not an expert, talented amateur, but beat the experts, highest student success rate I've ever seen of any trainer in any discipline. At least 5 times better than the best of the rest
- Mindset educator - probably top in the world, just sayin'
- Crypto enthusiast - talented amateur
- Bum - talented amateur, was planning to get better at it but finally got interested in something else
- Expertise in gold & silver - very, very talented amateur
- Mining stocks investing and swing trading - appear to be a very, very talented amateur

Now, I share all of that with you so that if there is one of you who is stupid enough to ever sue me and claim I gave you advice as an expert, then I am going to make you look like a fool in front of a judge. If you haven't guessed, I am using this guide to weed out problem people too.

Those of you who are grown-ups fully get this already and probably find me saying it funny. And it is you who are my ideal people to help. I am looking for people to help who have some funds behind them, who don't mind my style of training, and are comfortable with my current and growing level of skill—and who also like being in a mastermind group of like-minded people.

If that might be you, then it's time for the good stuff. So, let's continue—well, let's continue if you are interested in becoming a very talented amateur who by mistake found himself in the top 2% in the world.

If you check back to my emotional journey (image above), you will see that it was only during the last five calls I made that I got the consistency right. From the first correct call to buy, to the second call to sell, I captured about 65% of the move.

Then, from the third call to buy, to the fourth call to sell, I captured about 80% of the move. On the fifth call, I got closer to the bottom when buying, and I expect to now be closer to the top when selling.

So apart from my list of must-own stocks, my ongoing understanding of the companies, and the guidance I pay for from around twelve industry experts (more to come), what I really bring to the table is:

Some ability to market time.

You know, the thing anyone who gets into investing is told you can't do.

That's my superpower.

Well, that and my mindset.

And when you learn how I do it, then it will become your superpower too, as this is a LOT easier to learn than mindset resilience.

Now, for some specific results—and you'll have to forgive me for not keeping dead-on accurate results, because I had no plans at all to teach anyone this until last Sunday when I thought, "I want to go to Costa Rica again," (now Mexico) and I'd love to replicate the wonderful training and mastermind I did there in 2017 or 2018 (I can't remember which).

So I thought, ***"How do I get people to come along and spend a tidy sum to attend? What can I teach them that will be worthy of their time and money?"***

Well, the obvious answer, given that my ex-city desk trading manager had just told me I was an expert, was clear. So, I thought, we'll do it in April 2025. Then I thought, wait a minute, that's a topping area for the annual calendar in precious metals mining. When is it nearer a low annually? That led me to looking at February.

This way, I thought people could come along, place some positions at the bottom of the cycle, and then by May, they would've likely made most, if not all, of their money back for the training course. This, of course, depends on the sum they had to play with, their mindset, and their ability to learn and follow instructions. Given the results I just managed below, I'd say that it's not just possible—it's probable. Especially since I taught it to a friend who is terrible at technical trading.

(Current update on people's positions at recovering 100% of their costs to attend and hotel and transport costs after less than 8 weeks:

1 person has achieved over 100%

3 people are in the 75% range

3 people are in the 50% range

6 people are in the 30% range

3 people are in the 20% range

3 people are in the 10% range

4 people have forgotten how to use a calculator

All bar one person who has vanished have achieved, or are on the path to their first way-point, which is full recovery of all costs to attend - how many other courses can report this sort of return?

So, the days of giving friends some long-term holds are long gone.

I still do that for smaller positions (which I'll explain at the Mastermind), but for my larger positions, I actively move in and out. That means those massive 35% drops in portfolios, or the 70-80% drops in individual stocks, are a thing of the past. Thank goodness!

I think I've only had one 20% loser in my last 400 to 500 trades. And even that one, I turned into a winner. Now, I may be biased because I'll quickly get out of a trade if my opinion of it changes, and I don't really consider a 1 to 3% loss an actual loss. How can I say that? Because on the same day, I'll have ten or more 1 to 3% winners. So, you decide—did I lose or win?

Prior to this miraculous accomplishment, and right after the May highs, I watched my portfolio lose what I like to call 'a shit ton of money' as only a few months back, I still didn't want to sell. I hadn't overcome that mindset bug.

So I lost something like 30% on the first pullback from May, then the other 20% shortly after. I think. So I was approximately down 60% from the May high which also included some money I took out.

Now, for the first time since starting this account, I was in a loss. Years of what I like to call work, some call gambling, My wife calls it gambling. I like to kid myself at times and say it is investing, but mainly it is educated gambling as I am a realist most of the time...

Anyway, as I said all my work was reduced to a negative position. And I had to tell the wife as I don't do lying, far too much effort and way too many tangential downsides... So telling the wife you just lost a load of money never goes well (as all men know). Because we get no praise when we get it right, but loads of grief when we get it wrong, am I right guys, or what?

Anyway, I digress...

Then, near the end of June, I finally got it. I had stopped the loss, and I was gaining a lot. Looking at this more closely, I've had four or maybe five paradigm shifts in the last few months,

that being the first one. On the first upswing starting at the back end of June, where I captured 65% of the gain, I probably made around an 18% gain. What I mean by that is, the prices went up say 15%, and I captured 65% of that gain which resulted in an overall portfolio gain of 18%.

Then, I sold in early to mid-July. After that, I watched the market regularly, looking for signs to get back in. I started to cautiously rebuild positions in late July and early August. I saw the market moving in early August, so I rushed to take full positions again. I rode it up, saw it top in early September, and decided it was coming down, so I dumped 95% of my positions and captured another 10 to 15%. Sorry for the lack of accuracy, but I didn't know I was going to be talking about this back then.

I began rebuilding positions in early October. I saw the market moving again, so I went fully in last week, and as we speak, I am collectively up about 81% from my all-time low in mid-June. So, a pretty strong gain in about four months. I expect this run to take me well past a 100% gain, but I can't confirm that yet, as it hasn't happened.

This is an update as of 28th Oct as to what happened. The market dipped harder than I thought it would, so I decided to take the opportunity to get out and get back in later. The dip was indeed the 'sell the news' situation with the BRICS meeting last week (as I originally wrote about in the next few paragraphs). So it topped on Tuesday 22nd, and I got out on Friday 25th. Though I should've caught it on the Thursday. But I captured another 60%-65% of the move. Less than the target 80%, but still very, very good in my opinion. I'll aim to get it tighter and nearer to 80% next time.

What I can confirm is that I'm trading with plenty of profit. I'm not sweating it, I'm not suffering from fear of missing out, nor am I worried about my positions or market shocks. I'm just swing trading in a workman-like way.

It has become play, not struggle. The skill now is seeing how much profit I can squeeze out on each turn.

I am expecting a downturn as the BRICS meeting begins (a time when logic says prices should go up). So why do I expect a downturn? Because I am beginning to understand market traders' sentiment—they go counter-trend. Or as the traders say, buy the rumour, sell the news.

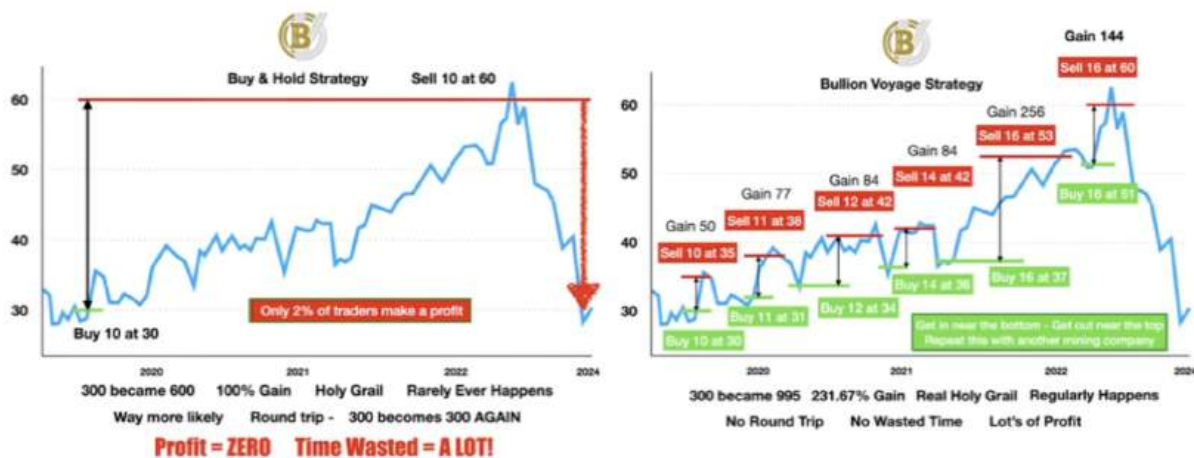

So, I will be ready to sell if this quick downtrend occurs. Likewise, if it doesn't, I'll let it ride. If it carries on without loss, then momentum waning will be the thing to consider and watch. So, I will exit then instead. I will count my gains and mark where I came out of trades so I can see if I can get back in and achieve owning more of the company but using less of my money.

So, rinse and repeat.

I made this video recently in an attempt to explain the difference between what I do and a traditional Buy & Hold strategy: [Click here to watch](#)

Buy & Hold Strategy VS Bullion Voyage Strategy

**Even If You Get It Wrong 50% of the Time
It Still Beats Buy & Hold**

So, did the market help me?

Yes, it did, but less than you'd think.

If I had just gotten the buy point right and not swung in and out, then currently the market move accounts for 29% of my gains. In other words, because the market moved, I would've made 29% just by buying at the right time and staying in the market.

But instead, I've made 81% gains so far by swing trading a pattern I will be explaining in simple detail to anyone who chooses to join me in Hampshire, England in June.

So, if you'd like to look again at my emotional flowchart, and you'd like to avoid those first four years of learning needed to get to the stage I'm at now—if you can ever get there, that is. Because I think I fluked it too. Plus, if you're not a socialist or easily offended by my blunt male attitudes, then I'd like to help.

I am looking to have people come along and attempt to give them as much of what I can about what I've learned in seven/eight days, while creating a group of people to mastermind with going forward.

I was only going to do this once. However, I think it is now my intention to replicate what I did with all the personal development authors in Las Vegas for six wonderful years. Once a year, we'll get together in a different place each time, train some new people, and meet old friends. I think that is a very good way to invest my time.

I cannot promise I'll do this forever; however, I guarantee I will participate fully in the Mastermind group as time allows, and I'll share everything I'm doing (everything I remember to share anyway) to maximize the returns for you over the following 12 months.

After that, I will probably continue with it, but no promises. There will, of course, be a monthly charge after 12 months, but by then, you'll either have learned enough that you won't need it, or you'll have made enough that the cost will be irrelevant compared to the value.

If that sounds good, and you feel this is EXACTLY the opportunity you've been looking for, then [click here](#) for more information about joining us in just eight weeks time...

Some frequently asked questions:

What level of prior investment knowledge is required to join the mastermind?

No prior experience is necessary. Whether you're a beginner or a seasoned investor, the mastermind covers everything from the basics to advanced strategies, allowing participants to build from any starting point. All trading favours those who can see patterns, and are reasonable with maths. But neither skillsets are necessary, they just make it even easier.

How much time will I need to dedicate to the follow-up mastermind over the next 12 months?

Expect to engage regularly, but the time commitment is very flexible. Updates and discussions will be provided, and you can choose how often you participate based on your availability. If you see the message from me saying, 'I'm all in'. You can choose to either rush in or take your time. Some of the stocks will have moved before you get in, some maybe cheaper. So you can choose to not get into the ones which have moved, and maybe put more in the ones that are a little cheaper - so it is very flexible.

How quickly can I expect to see results from the strategies taught?

Results vary based on your starting point, market conditions, and how quickly you implement the strategies. That said, I expect you to be ready to go at the event. The two best market timed moments are mid-Jan to early Feb and mid-Sep. So catching one of these two moves up which run for 6 to 10 weeks is really good. The idea is to get you ready to go and ready to catch one. That said, there are always stocks moving into their swing trade up moment, and stocks peeking. When I first looked at it the market seemed to move as one, it can do, but doesn't always. So to answer the question, Depending on how much you put to work will depend on the timeframe to going into profit. If you put \$50,000 to work during September, then there is a chance you could recover everything and more by mid-November. However, the process could take 4 to 9 months. Or if you put a lot more to work, say \$250,000 then you could recover all event costs and be in profit within 3 months. Nothing is set, but we are not talking years. When you see the strategy play out, you will see how accurate what I've written here is.

Are there any additional costs besides the retreat fee?

All meals and drinks during the retreat are covered, but participants will need to cover their own travel and accommodation. Additionally, the Trading View software has a separate fee.

How often will we receive updates or communications in the 12-month support?

You'll receive regular updates on market conditions, stock picks, and strategic insights, with more frequent updates when significant market events occur. Expect to engage with the group on at the very least a monthly basis, but you can participate as much or as little as you choose. I go through the whole curated list of stocks at the weekend before the market opens and share my list of 'Chosen Ones', which are the ones coming in to buying positions likely in the following week, and what I am taking profits on etc.

Why don't you want people who have less than \$50,000 to invest in Mining Stocks?

A few reasons. Because they'll be more scared and needy, and this often leads to more mistakes than someone who can handle the ebb and flow of trading. I want to see people recouping all their money from this event, including their travel costs, and be in profit well with a year. Three months if possible, as I want my success fee. This may be able to be achieved with less capital to play with, but I won't know that until I start seeing people's results come in from Mexico. So I may change this in the future, but not yet. So overall, I think this is a fair amount to begin with. Lastly, I really don't want grief for anyone just to make an extra few sales. I would rather go without the sales than have people who can't really afford to do this without struggling. I may later come up with a way to help those with less capital behind them, but nothing is set yet.

Why are you doing it in Hampshire in England?

I am doing it in Hampshire England because that's where I'll be when I'm training it. This aligns with my libertarian mindset. If I wanted to learn something from someone, I would go to where they were without considering if they could do it somewhere more convenient for me. The fact that you're asking this probably means you're not the right person for this. However, if you enjoy spending time in a beautiful country hotel with a group of like-minded people then I think you will love it.

What will I need to bring with me?

A laptop is essential. You aren't just going to sit and listen—you'll be doing it all. I plan to have you placing trades on day 6. The plan is to ensure you can do everything before you leave. I will also provide you a pen and Trading Journal. Make sure to get plenty of sleep before and during the event, as you will be pushed and have multiple paradigm-shifting moments, probably daily. If the same things happen here as happened in Mexico, when everyone realised the opportunity, they actually began to panic that they were risking missing out. So I had to calm everyone down, and get them to relax. Because even if you consider yourself to be a bit of an expert on this subject, I will be laying things out for you in a way that will reveal multiple profitable opportunities which it is extremely likely that you will not have seen. And that's if you are already a bit of an expert. So to someone new, frankly the opportunity should blow you away.

Who absolutely should attend and become part of this mastermind? - *Anyone with a pension fund that they control. Anyone with a stack of savings they want to protect. Anyone who wants to join the wild ride as the world changes. Anyone who wants to meet and get to know like-minded people. Anyone who wants to make way more money as the FIAT world collapses, anyone who wants their handheld. Anyone who wants to do this but like the protection of a herd of people all pointed in the same direction. Anyone who wants serious bragging rights as world events roll out?*
